

**Potential Amsoil customer!!**

I've been installing amsoil products in my vehicles and customer vehicles for years.

I don't sell anything that is not tried and proven by my experience and my seeing it for myself.

We were having lots of problems with Ford trucks overheating trans fluid and coming out the dipstick tube. (Sometimes catching the truck on fire because of fluid hitting hot exhaust manifold)

We work on a lot of Heavy Duty vehicles, local DPW's, Fire and Police cars/suv's.

We started off by installing large auxiliary coolers on the transmissions. (That brought the temp down but still not enough to fix the problem)

Then we started putting Amsoil in the transmission and watching the difference with transmission temperature gauges installed in the unit and found a huge drop in temperature by just changing the trans fluid over.

There has never been a failure due to overheating from any of the transmissions that we have rebuilt in many years that we have been using Amsoil in these vehicles.

Once again I have to see things work for myself before I would be able to sell it to the consumer. I need to sell myself first
